INTRODUCTION

1 Introduction:

Hospital administrators are often inundated with information about a large number of patients and their visits to the hospital that need to be organized and kept up-to-date. The patient management system is a web based application that is designed and developed for hospital administrators and doctors to organize information on patient visits. The system intends to facilitate several steps in the process from the patient registration and to the patient evaluation. During this process, there will be many tasks that have to be handled by this system including maintaining complete information. The main objective of the system is to provide the administration staff and doctors with an easily maintainable information system for patient registration, visit scheduling and patient tracking with latest information.

Description:

Description:

Description:

LIMITATION OF THE PROJECT

3. Limitation of the system

The size of the database increases day-by-day, increasing the load on the database back up and data maintenance activity.

Training for simple computer operations is necessary for the users working on the system.

FUTURE SCOPE OF THE PROJECT

4. Future scope of the System

This System being web-based and an undertaking of Cyber Security Division, needs to be thoroughly tested to find out any security gaps.

A console for the data centre may be made available to allow the personnel to monitor on the sites which were cleared for hosting during a particular period.

Moreover, it is just a beginning; further the system may be utilized in various other types of auditing operation viz. Network auditing or similar process/workflow based applications...
